

MEMS TUNABLE OPTICAL FILTER

With Control Board

OVERVIEW

sercalo's Tunable Optical Filter is based on MEMS technology and is designed for ITU C and L band with a FWHM bandwidth of 0.6 nm. It can be independently controlled by an UART interface or an I²C/SMBus serial bus and features a user-programmable channel grid. The highly reliable tuning mechanism uses an integrated micro-mirror with switching time below 50 ms and insertion loss below 3 dB. The component is designed to conform to Telcordia 1221 reliability standards.

FEATURES

- *45 x 23 x 10 mm³ size*
- *User-programmable channel grid*
- *UART and I²C/SMBus interface*

APPLICATIONS

- *Reconfigurable Optical Add/Drop Multiplexers*
- *Optical power monitors*
- *Optical sensor interrogators*
- *Low cost spectrometer*
- *Low cost tunable laser*

DESCRIPTION

The tunable Filter is composed of an optical system and an electrical driver interface with a size of only 45 x 23 x 10 mm³. Light from the input fiber is collimated onto a fused silica grating. The grating diffracts the incoming light into its spectrum with a distinct angle for each wavelength. A MEMS mirror reflects the light onto the output collimator, which only couples a small fraction of the spectrum into the output fiber. By modifying the mirror tilt angle user can chose the wavelength of the filter.
